Puggle

App screens, flows and the people it is for

14 November 2026 · Working document

Screens are from the app as built on 14 November, running a made-up sample family. Flow text is the design from `docs/flows.md`; the app does not yet do every step described. No real family's data appears here.

Who it is for

Every leading tracker is built around one baby and one subscription. Real families have a newborn and a toddler, or twins, plus a partner, grandparents and a nanny. Puggle is family-first: several children logged at once without switching profiles, properly native to iPhone, fairly priced, and calm.

Primary
Parents of a newborn who also have an older child, and parents of twins or more.

Secondary
First-time parents who want a calmer, better-made tracker.

Supporting cast
A partner, grandparents, a nanny, daycare. They need a simple role with limited permissions and no account to make.

The first household it is built around: a bottle-fed six-month-old and a potty-training two-and-a-half-year-old. Twins are an explicit design target.

The three levels in a family

- **Parent:** can do everything.
- **Helper:** logs the day, and can change only their own entries.
- **Viewer:** sees the day, cannot log.

Personas

Two rounds of structured critique have been run with personas. **Neither is user testing: no real parent has used the app yet.** They are good at finding gaps and unclear wording.

Round 1: eight personas walk the flows (11 November)

Each read the journeys and wireframes as a particular kind of parent or carer. The verdicts are on the design as it stood then; many of the gaps have been worked on since.

PERSONA	WOULD THEY KEEP USING IT?
1. Mum and Dad, first four days home Caesarean recovery, breastfeeding trouble, a midwife asking for every feed and nappy.	For nappies and top-ups, yes, alongside the midwife's paper chart. It reads as a tracker for a six-month-old, not for week one.
2. Parents at three months Looking for patterns, giving medicine, a return to work, switching from another app.	Would try it, would not stay: no health logging, and Insights is too shallow.
3. Toddler mid potty-training plus a two-week-old Two children at very different stages.	Would keep the potty sticker and the feed timer, and drop the rest within a fortnight.
4. Grandmother minding two children Large text, no glasses, unsure of iCloud.	Not on her own by day two.
5. Parents of eight-week-old premature twins On a hospital schedule.	Not yet: better than apps that switch between babies, but every sheet assumes one child and one amount.
6. The invited second parent, and a professional nanny Joining someone else's family.	He would drift after a few weeks; she cannot do her job with it.
7. Accessibility A blind father using VoiceOver, a low-vision colour-blind mother, anyone one-handed.	Not yet accessible.
8. An anxious mother, a privacy-minded father, a parent burned by other apps Trust, calm and data.	Not safe for the anxious mother as drawn; the other two would probably stay.

Round 2: six testers on the built app (13 November)

1. A single parent with a three-week-old, alone, one-handed at night.
2. A grandmother who is the sole carer of a 14-month-old and a four-year-old, at the largest text size.
3. One family at every level: two mothers, twins and a toddler, a Nan as Helper, an uncle as Viewer, a nanny added and removed.

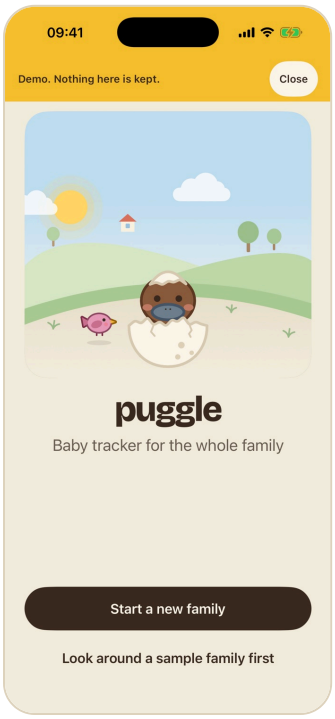

4. Families the design did not have in mind: co-parents in two homes, a foster carer, a baby born at 29 weeks, a family after a loss, a parent with postnatal anxiety, adoptive and trans parents.
5. Accessibility: VoiceOver, the largest text, one hand or a tremor, colour blindness with twins, reading difficulty, Reduce Motion.
6. Hands-on in the simulator: first run, logging and undoing, History, Insights, Family, Play, and the Helper and Viewer views.

Full findings: `docs/persona-testing.md` and `docs/usability-findings.md`.

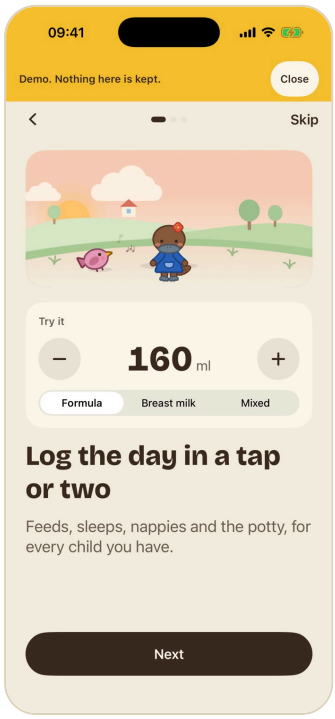

App map

- **First time:** Splash (name shows here); Hello (2 screens, skippable); Add a child (the only required step); Character (friend or photo); Invite (optional)
- **Today (tab):** Children (their day so far); Tiles (built from two setup questions); Log sheets (feed, nappy, health…); Last saved (undo that stays); Sticker moment (after a potty success)
- **History (tab):** Timeline (by day); Filter (who and what); Edit entry (change or delete)
- **Insights (tab):** Last night (per child); Trends (weekly); Summary (PDF to share)
- **Family (tab):** Children (pages, characters); People (invite, roles); Settings (night, units, reminders); Pro and tips (free core); Help and about (name shows here)
- **Outside the app:** Lock Screen (sleep and feed timers); Widgets (last feed, asleep for); Notifications (only ones you switch on); Invite link (opens Join)

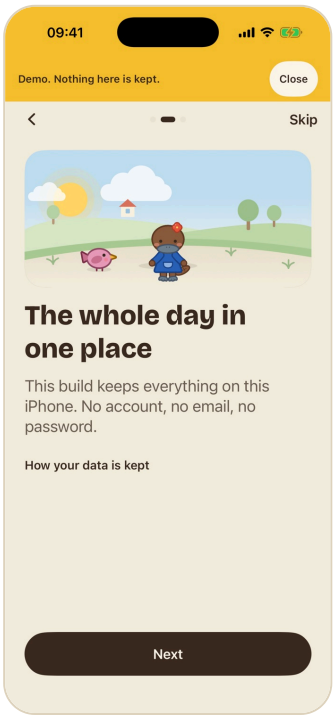

1. First run

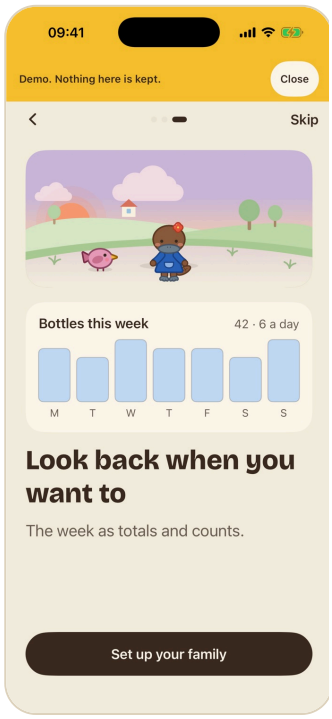

Welcome: the egg hatches, then the name

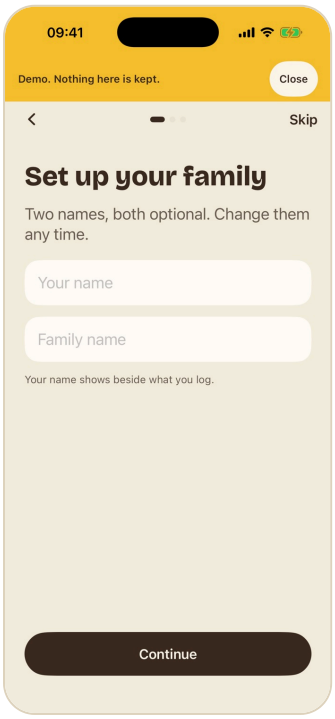

Page 1: a stepper to try

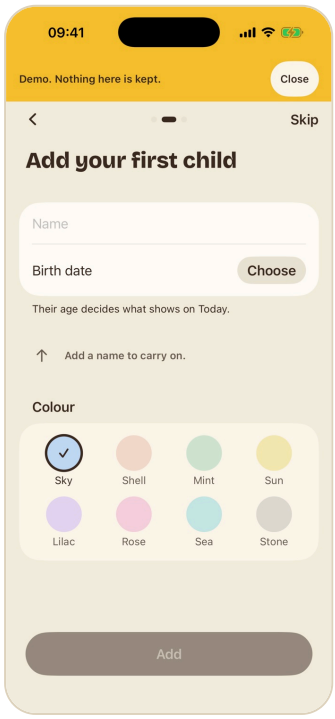

Page 2

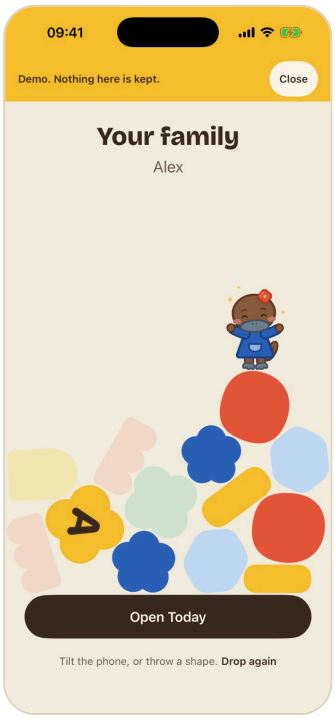

Page 3: a week

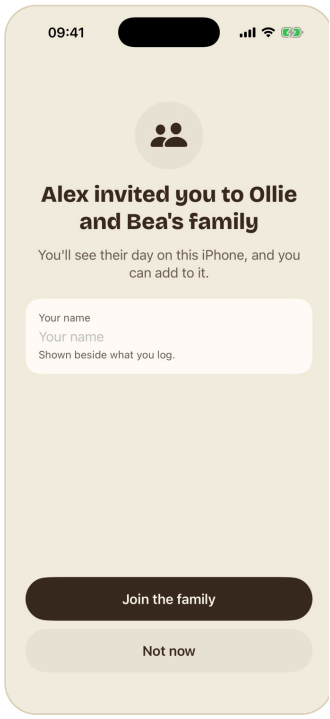

Set up your family

Add your first child

The finish: your family

Joining by invite

The yellow "Demo" bar is from the Developer menu's run-through and is not part of first run. Page 2 is shown as a test build that keeps data on the phone; the iCloud build shows three people at the three levels and adds a "Who else looks after them?" screen.

From install to Today in under a minute. No account, no email, no password. Nine screens on a new parent's path.

1. **Welcome.** The egg hatches once, in the scene for the time of day, then the name and "Baby tracker for the whole family" appear. Start a new family, I've been invited, or look around a sample family.

2. **Log the day in a tap or two.** A bottle stepper to try. Nothing is saved.
3. **Everyone sees the same day.** Three people at the three levels.
4. **Look back when you want to.** A week as totals and counts. The scene runs from dawn to dusk across these three pages; after dark it is night throughout.
5. **Set up your family.** Your name and the family name, both optional.
6. **Add your first child.** Name, birth date and how they feed.
7. **Anyone else?** Each child added, with a tick. Add another returns to the form.
8. **Who else looks after them?** Parent, Helper and Viewer explained, and Invite someone. Not shown in a build that can't share.
9. **Your family.** The brand's soft shapes, flat in the brand colours with no outline, drop in and pile up, lettered for you and the children. Tilt the phone or throw one. Puggle stands on top and cheers once when it lands. The title becomes the family's name. Open Today works from the start.

Rules and edge cases:

- Skip on the three pages goes to setup. Skip on a setup screen moves to the next. Skipping the first child goes to Today, which offers to add one.
- Leaving half way reopens on the same screen. A child already added is kept.
- "How much to see" is in Settings, not first run. Everyone starts with everything shown.
- Someone joining by invite sees "You've joined the family", gives their name, then the heap with a letter for everyone already in it. A family coming back from iCloud on a new phone goes straight to Today.
- Notifications are asked for later, the first time a reminder is switched on, never at launch.
- If iCloud is signed out, setup still works and says so; sharing explains what's needed (see Edge states).
- Reduce Motion: still pictures, and the heap is shown already landed. VoiceOver reads the heap as the list of names.

2. Everyday logging

Today, by day | Bottle sheet, with the tin | Nappy: one tap saves

The core loop. One tap for the common case, a sheet for detail, never more than two taps deep.

1. **Today.** Every child at once, each with their day so far. Tap a tile to open that activity's sheet.
2. **Bottle sheet.** Who (ticked, never colour alone), how much, what, when. Remembers each child's last amount. The number can be typed. Reminders are off until asked for.
3. **Saved.** Saves instantly and Puggle nods. "Last saved" stays on Today, with Undo and Change, until the next save. It names the child.
4. **Nappy: one tap.** Three big choices; tapping one saves. No Save button.
5. **Breastfeed.** From its own tile. Left and right timers that run on the Lock Screen, or "Enter a past feed" with side, start and length.
6. **Solids.** Food as chips, how it went. New foods are remembered for next time.
7. **Edit or delete.** Tap any entry, anywhere, to change it. Delete asks once.
8. **The day so far.** Tap a child's row. Counts for today and the last 24 hours, from the first entry.
9. **Log something earlier.** Time opens a wheel. "Earlier today" and "Yesterday" are one tap.

Rules and edge cases:

- Twins: "Both" logs one entry per child, each editable on its own.
- Each sheet opens on the child last logged for that activity, shown with a tick. For children born on the same day it never guesses: pick one, or Both.
- Undo never times out; it is replaced by the next save.
- Offline: saves on the phone and syncs later, with no error shown.
- Reactions never delay a save (see Motion direction).

3. Sleep

No screens pictured for this flow.

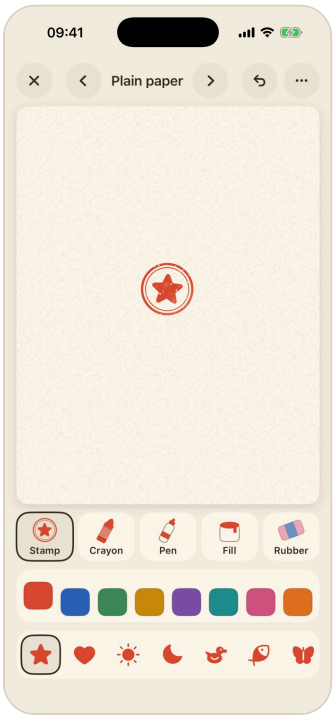

Start and stop from Today, see it on the Lock Screen, fix it afterwards if you forgot.

1. **Tap “Start sleep”.** One tap on the child’s row starts the timer. The button is a verb, and VoiceOver reads it with the name: “Start Ollie’s sleep”.
2. **Sleeping.** The row turns night blue with a live timer. For the first minute “Woke up” reads “Cancel”, so a stray tap leaves no entry.
3. **Lock Screen.** A Live Activity shows who is asleep and for how long, with a Woke up button.
4. **Woke up.** Stops the timer and shows the length. Start and end can be nudged.
5. **Forgot to start it.** Log a past sleep from the Sleep card: two times and it’s done.

Rules and edge cases:

- Forgot to stop it: after 14 hours the app asks “Still asleep?” next time it’s opened, and offers to set the wake time.
- Each child has their own timer; twins can be started together with “Both”.
- Quiet mode follows night hours, or the one child who is asleep. A sleeping baby does not mute a toddler’s sticker.
- A night waking can be added inside a sleep without ending it.

4. Potty training

The play pad

Only the play pad is shown. The sticker chart is built but not pictured here.

For the toddler. Logging is quick; the reward is a sticker the child chooses.

1. **Potty sheet.** What happened and where. “Tried” counts: effort is rewarded too.
2. **Pick a sticker.** After a success the phone goes to the child. Only the stickers can be tapped; a parent holds the corner for two seconds to take it back.
3. **Sticker chart.** A week at a glance. Lives under the Potty card and on Ollie’s page.
4. **Ten stickers.** Every ten stickers earns a holographic one. It adds up; an accident never takes anything away.
5. **Time to try?.** An optional reminder. Puggle does the potty dance; never a nag.

Rules and edge cases:

- Accidents are logged plainly, with no sad Puggle, and are never shown on the child’s chart. Parents can see them in History.
- The sticker moment plays in full even when a baby is asleep.
- The sticker step can be skipped or switched off.
- Open decision: the potty method (child-led or timed) changes the default reminder.

5. History and insights

History | An entry | Insights: the week | Insights: patterns

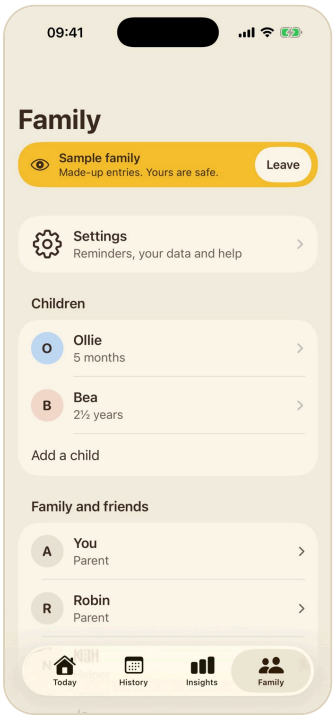

Look back, spot patterns, and hand a clear summary to a doctor or a carer.

1. **History.** Everything, newest first, by day. Tap to edit; swipe to delete.
2. **Filter.** By child and by activity. Stays set until cleared.
3. **Last night.** The question every parent asks at 7 am, answered in one card per child.
4. **Trends.** Simple weekly charts with outlined bars. No averages, no scores, no “behind”.
5. **Share a summary.** A one-page PDF for the GP, the child health nurse or day care.

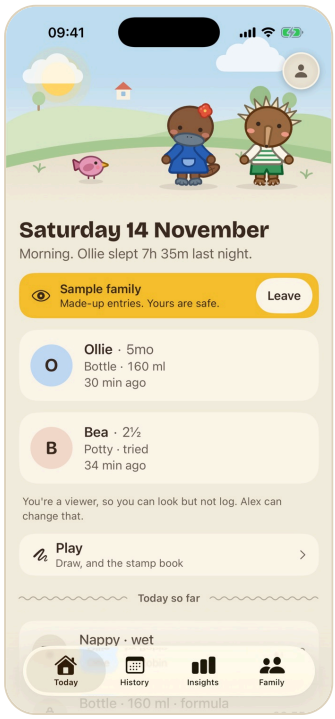

Rules and edge cases:

- Insights never compare a child with other children, and show ranges, not averages. Each child has their own card with their name on it.
- Open decision: whether the summary for the doctor is free or part of Pro. It is drawn as free.
- With less than three days of data, Insights says so plainly and shows what there is.

6. Family and sharing

Family

Today as a Viewer: can see, cannot log

One family, many phones. Built on iCloud sharing: no accounts, no passwords.

1. **Family.** Children at the top, the people who help below.
2. **Invite.** Choose what they can do, then Apple's share sheet sends the link.
3. **They open the link.** On their phone: who invited them and to what. One button.
4. **Shared day.** Their Today is the same Today. Entries say who logged them.
5. **Manage a person.** Change what they can do, or end their access. Everything they added stays.

Rules and edge cases:

- Needs iCloud on both phones. If the app isn't installed, the link goes to the App Store first and resumes after.
- An invite link works once and expires after seven days.
- The interface never shows an "owner". If the parent whose iCloud holds the family leaves, the app offers to move it to the other parent first.
- Open decision: people without an iPhone cannot join in v1, and the invite sheet says so.

7. Children and characters

No screens pictured for this flow.

Each child has a page: who they are, their character, and what's theirs.

1. **Child page.** Their summary and everything that belongs to them.
2. **Edit details.** Name, birth date, colour. All optional except the name.
3. **Character builder.** Friend, outfit, colour. The same builder as on the canvas.
4. **Or a photo.** A photo sits in the same round frame everywhere a character would.
5. **Growing up.** Activities change with age. The app suggests; the parent decides.

Rules and edge cases:

- Archiving hides a child from Today but keeps all their history; it can be undone.
- Deleting a child is separate, asks twice and removes their entries for everyone.

8. Milestones and growth

No screens pictured for this flow.

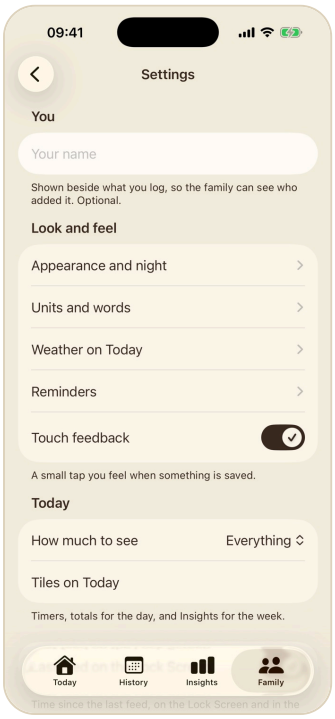

The moments worth keeping, and the numbers the nurse asks for.

1. **Add a milestone.** Pick a first, or write your own. Photo optional.
2. **Celebrate.** The one big reaction in the app: hooray, quatrefoils, a shiny sticker.
3. **Their timeline.** Milestones in order, with ages worked out for you.
4. **Log a measurement.** From the Weight tile on Today. Typed to the gram; units follow the phone's region.
5. **Growth chart.** Plotted on WHO percentile bands. Shown, never scored.

Rules and edge cases:

- Milestone suggestions come from public child-health sources for the user's country and are phrased as "around", never as deadlines.
- Growth charts always carry the same line about the nurse or GP, whatever the numbers. The band is labelled and can be hidden.

9. Settings, Pro and Help

Settings

Few settings, honest pricing, and the only other place the app's name appears.

1. **Settings.** Reached from the Family tab. Short on purpose.
2. **Pro and tips.** Everything needed to track is free, for ever. Pro is a one-off; tips are thanks.
3. **Thank you.** A real thank-you, then straight back. No upsell after.
4. **Import.** Bring history from another tracker. Shows what it found before adding.
5. **Help and about.** Short answers, a way to reach us, and the name.

Rules and edge cases:

- Open decision: the Pro price.
- No ads, no tracking, no analytics. See "Your data" in Calm and private.
- Export gives the family everything, in plain files, at any time.

10. When things go wrong

No screens pictured for this flow.

Calm, plain and never the parent's fault. Logging always works, whatever else is broken.

1. **No iCloud.** The app works on this phone. Sharing explains exactly what to switch on.
2. **Offline.** No error. A small note; everything syncs when it can.
3. **Logged twice.** Two people log the same bottle. The app asks once, kindly.
4. **Invite didn't work.** Says why in plain words and offers the next step.
5. **Still asleep?.** A timer left running for 14 hours gets a gentle question, not a wrong chart.
6. **Notifications off.** Asked only when a reminder is first switched on, with the reason.

Rules and edge cases:

- Sync conflicts resolve by "latest edit wins" per entry; deletes win over edits.
- If iCloud storage is full, the app says so once and keeps working on the phone.
- Every screen must work with Reduce Motion, the largest text size and VoiceOver before it ships (see Large text, VoiceOver and night). The first build does not yet.

11. Health

No screens pictured for this flow.

Medicine, temperature and vaccinations, logged plainly. The app records what the parent tells it; it never advises.

1. **Log a medicine.** From the Health tile. The medicines this family uses are one tap; the next time comes from the gap the parent set.
2. **Too soon?.** If a dose is logged inside the gap the parent set, the app asks once. It never blocks.
3. **A regular medicine.** Set once: dose, times, the smallest gap. Reminders are quiet and belong to whoever switches them on.
4. **Due on Today.** What is due shows on the child’s row and goes when it’s logged. Nothing turns red if it’s late.
5. **Temperature.** A number, where it was taken, and the time. No colour, no “high”, no alarm.
6. **Vaccination.** A record, not an event: saved with the usual small nod, never the celebration.

Rules and edge cases:

- The app never suggests a dose, a gap, or whether a temperature is high or normal. Every number comes from the parent.
- Health entries appear in History and in the summary for the doctor.
- A helper sees only the medicine due during their day, unless a parent chooses otherwise.
- Supplements and vitamins are regular medicines.

12. Setup that fits the child

No screens pictured for this flow.

Two questions per child build their Today. A newborn's screen is not a toddler's.

1. **How do they feed?.** Asked once per baby, after their name. It decides which tiles they get.
2. **What about a toddler?.** For older children: potty training and naps, yes or not yet.
3. **A newborn's Today.** Feeds, nappies and weight first. The row shows the side and when the last feed started, and the last 24 hours.
4. **A feed, after the fact.** No timer needed: side, start and length. At 3 am this is how most feeds get logged.
5. **Nappy, with more if asked.** One tap still saves. Colour and time can be added after, for families whose midwife asks.
6. **Weight in grams.** Typed, to the gram, from a tile on Today. Shows the change from birth as a plain number.

Rules and edge cases:

- Tiles follow the answers and the child's age; the app suggests changes as they grow and the parent can always say no.
- The last-24-hours panel shows from the first entry, with no wait for "enough data".
- The change from birth is a number only. The app does not say whether it is fine.
- Babies under two weeks get no percentile chart unless a parent asks for it.

13. Helpers

No screens pictured for this flow.

For a grandparent, a nanny or a friend: a simpler app that only logs, with the parents' notes at the top.

1. **Invite a helper.** A parent chooses Helper and which days. The sheet says plainly what a helper needs.
2. **What you're joining.** Three plain lines before anything else. Nothing to set up.
3. **A helper's Today.** One column, large type, four big buttons, no other tabs. The parents' note is at the top.
4. **A note for the parents.** Free text that belongs to the day, not to an entry.
5. **The parents' side.** A parent writes "For today" once; it shows to whoever is helping that day.
6. **End of the day.** A summary of the helper's day to hand over, then they're done.

Rules and edge cases:

- A helper's screen is designed at the largest text size first.
- Every entry shows who added it; every edit shows who changed it and when.
- Outside their days a helper gets no notifications and sees nothing new.
- Ending a helper's access keeps everything they added.
- Open decision: a helper without an iPhone cannot join. A link that works in any browser would need a server.

14. Twins and pumping

No screens pictured for this flow.

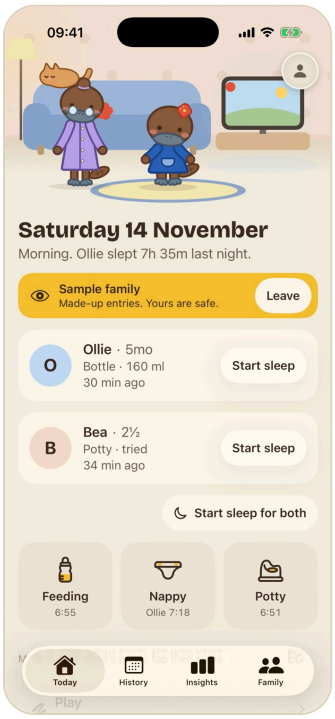

Two babies at once with their own amounts, and milk that belongs to the parent.

1. **Pick a twin, or both.** For children born on the same day the sheet never guesses. Each twin gets a different character.
2. **Both, with their own amounts.** Choosing Both gives a row each, filled in from each baby's last feed.
3. **Pump.** A Pump entry belongs to the parent, not to a baby. Left, right and where it went.
4. **Milk on hand.** A simple running total of what's in the fridge and freezer. Bottles of breast milk take from it.

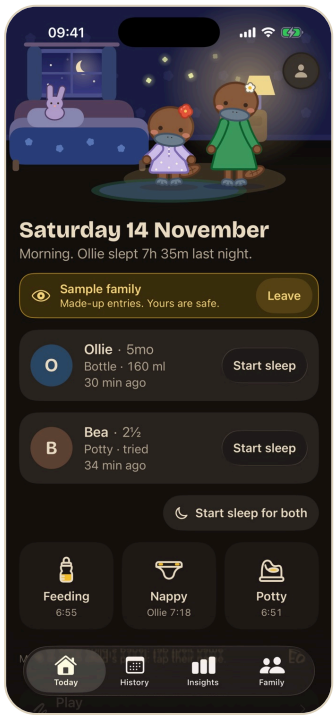

Rules and edge cases:

- "Same bottle?" is only asked about the same child. Two twins fed at the same minute is normal.
- The Lock Screen shows a line per sleeping or feeding child.
- Open decisions: a side-by-side view for twins, and corrected age for babies born early.

15. Calm and private

Evening: indoors after 18:00

Bedtime, in the night look

For parents who want less on the screen, and for anyone who asks where their data goes.

1. **How much to see.** Asked once in setup. Either choice logs the same things.
2. **Today, just logging.** Names and tiles. Nothing counts up and nothing is totalled.
3. **Your data.** One screen, in Settings and linked from setup. Plain answers and two buttons.
4. **Delete everything.** Says exactly what will happen, offers a copy first, and then does it.
5. **Finding support.** Always in Help, the same for everyone. The app never decides a parent needs it.
6. **Our promise.** On the Pro screen and in Help, in writing.

Rules and edge cases:

- “Just log” hides Insights, elapsed-time counters, totals, percentile bands and all counts, on widgets too.
- The app never reacts to how often it is opened or to gaps in the log.
- Helpline numbers must be checked for each country before release.
- Open decision: exactly what Pro contains.

16. Large text, VoiceOver and night

No screens pictured for this flow.

The same screens for a parent who can’t see them well, can’t see them at all, or is looking at them in the dark.

1. **Today at the largest text.** One column. Each child’s row stacks; the button names the child and spans the width.
2. **A sheet at the largest text.** Choices become a list of large rows with a tick. No segmented controls, nothing truncated.
3. **Night.** Very dim, warm text on near-black, no white anywhere. Switches by itself after dark or while a child sleeps.
4. **What VoiceOver says.** Each row is one stop with a full sentence, and its actions are named.

Rules and edge cases:

- Every control is at least 44 pt, with 8 pt between neighbours.
- Selection is always a tick and a border as well as a colour. Children are always named; colour and character are extras.
- Text is never below 13 pt at the default size; status lines are 15 pt.
- Charts have outlined bars, a value on each, and a spoken description.
- Undo never times out.
- Measured contrast: main and muted text pass AA on every surface; destructive red is darkened to pass.

17. Outside the app

No screens pictured for this flow.

Most looks at Puggle should never open it: the Home Screen, the Lock Screen, a notification, a word to Siri.

1. **Home Screen widgets.** Small: one child at a glance. Medium: every child, with buttons that log without opening the app.
2. **Lock Screen, several at once.** One line per running timer, each with its own button.
3. **My notifications.** Each person chooses their own. Nobody is switched on by someone else.
4. **Ask Siri.** Every log action works by voice, from the Action button and in Shortcuts.

Rules and edge cases:

- Widgets, Lock Screen timers and Siri are free, for ever.
- Lock Screen timers last about eight hours on iOS; a longer sleep carries on in the widget.
- A timer started on one phone shows in the app on the others straight away, but not on their Lock Screen. That would need a server.
- In “Just log” mode widgets show names and buttons only.
- Apple Watch is planned for later.
